Strings - Practice Problem

Define a function `get_address()` that accepts a email header string as input. It should then extract the portion of the email address that comes after the `@` symbol

For example, given the argument- `stephen.marquard@uct.ac.za Sat Jan 5 09:14:16 2008` The function should return - should return `uct.ac.za` Test out this function by calling it with various inputs. Assume that sometimes the portion after the address may not exist.

```
uct.ac.za
```

```
utdallas.edu
```
